

## Activity No. 5: Docker practical session [10%]

Docker is a command line-based software allowing users to manipulate images and create application containers.

As presented in the course, Docker consists of two elements:

- a client, to receive commands from the user
- a server, to execute commands and manage images and containers

### Docker commands architecture

Typing this command will give the Client and Server versions available on your computer.

**Paste a screenshot of result**

<code>docker version</code>	<pre>PS C:\Users\usuario&gt; docker version Client: Version:      27.0.3 API version:  1.46 Go version:   go1.21.11 Git commit:   7d4bcd8 Built:        Sat Jun 29 00:03:32 2024 OS/Arch:      windows/amd64 Context:      desktop-linux error during connect: Get "http://%2F%2F.%2Fpipe%2FdockerDesktopLinuxEngine/v1.46/version": open //./pipe/dockerDesktopLinuxEngine: The system cannot find the file specified. PS C:\Users\usuario&gt;</pre>
-----------------------------	---

Usage, options and a full list of available commands can be accessed through the command line in a terminal. Type the following command

<code>docker --help</code>
----------------------------

The general usage of a Docker command line is as follows:

```
docker [OPTIONS] COMMAND [arg...]
```

## Questions

1. How many arguments are absolutely required by the command 'docker pull' ?  
R/The docker pull command requires 1 argument: the name of the image.
2. Do you remember what a registry is? R/ Es un sistema de almacenamiento y distribución de imágenes.

## Download a predefined image available on the DockerHub

In a web browser, navigate to the DockerHub : <https://hub.docker.com/>

In the top search bar, type : japeto/pujgcc and paste a screenshot

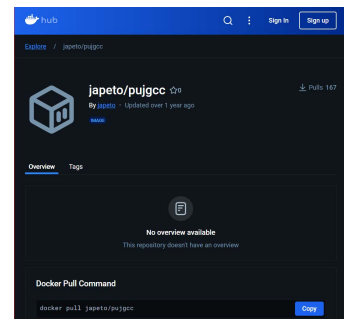

Our course has images available for the development of practical sessions.

## Questions

1. How many times was the *japeto* image downloaded ? R/ 167

Execute the command inside a terminal.

**Paste a screenshot of result**

```
docker pull japeto/pujgcc:v0.12
```

You will get an error as this image has no default tag ("latest"). So we need to specify one in the command line.

Go to the "Tags" tab and copy the pull command of version latest

**Paste a screenshot of result**

```
docker pull japeto/pujgcc:v0.12
```

```
PS C:\Users\usuario> docker pull japeto/pujgcc
Using default tag: latest

What's next:
  View a summary of image vulnerabilities and recommendations → docker scan
  or quickview japeto/pujgcc
Error response from daemon: Head "https://registry-1.docker.io/v2/japeto/pujgcc/manifests/latest": unauthorized: incorrect username or password
PS C:\Users\usuario> docker pull japeto/pujgcc
Using default tag: latest
latest: Pulling from japeto/pujgcc
aa13ed18d033: Pull complete
15a33158a136: Pull complete
f67323742a64: Pull complete
c4b45e832c38: Pull complete
e5d4afe2cf59: Pull complete
1efbd2d5674a: Pull complete
822a58c16177: Pull complete
6461d3be7619: Pull complete
8287aab02fcd: Pull complete
edd3d1d6fad6: Pull complete
c6dbbe32db7e: Pull complete
Digest: sha256:9b3d7bbf410396d0a26e6bcffbb54e4239736d5a23ad694b83d93c26f9fc6
668
Status: Downloaded newer image for japeto/pujgcc:latest
docker.io/japeto/pujgcc:latest
```

## Question:

1. How many times do you see 'Pull complete' displayed ?  
Why ? R/ 11 VECES

Now, to be sure that the image was correctly pulled, let's see the list of all available downloaded images inside our workspace. **Paste a screenshot of result**

```
docker image
```

```
Windows PowerShell
PS C:\Users\usuario> docker image

Usage: docker image COMMAND

Manage images

Commands:
  build      Build an image from a Dockerfile
  history    Show the history of an image
  import     Import the contents from a tarball to create a filesystem image
  inspect    Display detailed information on one or more images
  load       Load an image from a tar archive or STDIN
  ls         List images
  prune      Remove unused images
  pull       Download an image from a registry
  push       Upload an image to a registry
  rm         Remove one or more images
  save       Save one or more images to a tar archive (streamed to STDOUT by default)
  tag        Create a tag TARGET_IMAGE that refers to SOURCE_IMAGE

Run 'docker image COMMAND --help' for more information on a command.
PS C:\Users\usuario>
```

	PS C:\Users\usuario> docker image ls				
	REPOSITORY	TAG	IMAGE ID	CREATED	SIZE
	japeto/pujgcc	latest	05141310a94c	19 months ago	1.39GB

Question:

1. What is the size of the japeto/pujgcc image ? R/ 1.39GB

## Perform a task using a pulled image

Among the Docker commands, we will now use the 'run' command.

Question:

```
Usage: docker run [OPTIONS] IMAGE [COMMAND] [ARG...]
```

1. What are the options and parameters of the 'run' command  
[OPTIONS][COMMAND][ARG...]

```
docker run --help
```

As displayed in the terminal, the description of the command is 'Run a command in a new container'. Question :

1. What is the difference between an image and a container ?  
R/ Imagen: Es un archivo de solo lectura que actúa como una plantilla para crear contenedores.  
Contenedor: Es una instancia de la imagen en ejecución, que es mutable y puede realizar tareas aisladas dentro de su entorno.

Now, to run the application, execute the following command:

**Paste a screenshot of result**

```
docker run japeto/pujgcc bash --help
```

```
PS C:\Users\usuario> docker run japeto/pujgcc bash --help
GNU bash, version 4.3.30(1)-release (x86_64-pc-linux-gnu)
Usage: bash [GNU long option] [option] ...
        bash [GNU long option] [option] script-file ...
GNU long options:
  --debug
  --debugger
  --dump-po-strings
  --dump-strings
  --help
  --init-file
  --login
  --noediting
  --noprofile
  --norc
  --posix
  --profile
  --restricted
  --verbose
  --version
Shell options:
  -ilrsD or -c command or -O shopt_option          (invocation only)
  -abefhkmptuvxBCHP or -o option
Type 'bash -c "help set"' for more information about shell options.
Type 'bash -c help' for more information about shell builtin commands.
Use the 'bashbug' command to report bugs.
```

**Congratulations!**

**You just successfully downloaded and used your first Docker image!**

Running *PUJGCC* without parameters was interesting as a demonstration of Docker's features. But if we want to really run *PUJGCC*, we also need to provide parameters and, most importantly, input files.

## Find the paths to bind

To bind our current folder to the /data/ folder located inside a container, we first need the absolute path of the current folder, obtained through the unix `pwd` command.

**Paste a screenshot of result**

pwd	PS C:\Users\usuario> pwd	
	Path	
	----	
	C:\Users\usuario	

Instead of running ls command to /home/ files, we will now just list the content of the /data/ folder inside the container but bind with the host.

docker run japeto/pujgcc:latest ls /data

```
PS C:\Users\usuario> pwd
Path
----
C:\Users\usuario

PS C:\Users\usuario> docker run japeto/puigcc:latest ls /data
ls: cannot access /data: No such file or directory
PS C:\Users\usuario>
```

We now have the paths of the two folders we want to bind together.

To perform the folder mapping between the current folder and /data inside the image, the syntax is simple. **Paste a screenshot of result**

<code>docker run -v \${PWD}:/data/ japeto/pujgcc:latest ls /data/</code>

[illegible]

1. Is the displayed list the same as what is in your current folder?  
R/ NO

**Paste a screenshot of result**

```
docker run -v ${PWD}:/data/ japeto/pujgcc:latest gcc /data/helloworld.c
```

```
PS C:\Users\usuario> docker run -v ${PWD}:/data/ jpeto/pujgcc:latest gcc /data/helloworld.c -o /data/helloworld
PS C:\Users\usuario> docker run -v ${PWD}:/data/ jpeto/pujgcc:latest /data/helloworld
Hello, World!
PS C:\Users\usuario> |
```

```
PS C:\Users\junior> docker run -it --name temp-container japeto/puigcc
c:latest /bin/bash
root@9c6fc29c437b:/# cd /data
bash: cd: /data: No such file or directory
root@9c6fc29c437b:/# nano helloworld.c
root@9c6fc29c437b:/# gcc helloworld.c -o helloworld
bash: gcc: command not found
root@9c6fc29c437b:/# docker run -v $PWD:/data japeto/puigcc:latest g
cc /data/helloworld.c
bash: gcc: command not found
root@9c6fc29c437b:/# nano helloworld.c
root@9c6fc29c437b:/# gcc helloworld.c -o helloworld
root@9c6fc29c437b:/# ./helloworld
Hello, world!
root@9c6fc29c437b:/#
```

## Learn how to re-use a container where you installed something

**Paste a screenshot of result**

<code>docker start -ti mycontainer /bin/bash</code>

Go back to the container using the exec command instead of the run command.

**Paste a screenshot of result**

```
docker exec -ti mycontainer /bin/bash
```

Question :

1. What happens now when you exit the container? Is it stopped?  
R/ No se detiene por default

Check with and **Paste a screenshot of result**

```
docker ps -l
```

```
PS C:\Users\usuario> docker start mycontainer
mycontainer
PS C:\Users\usuario> docker exec -it mycontainer /bin/bash
root@d9c9b08f80b:/# exit
exit
What's next:
  Try Docker Debug for seamless, persistent debugging tools in any container or image + docker debug mycontainer
  Learn more at https://docs.docker.com/go/debug-cli/
PS C:\Users\usuario> docker ps -l
CONTAINER ID   IMAGE          COMMAND                  CREATED        STATUS        PORTS          NAMES
4812c3aac174   jpeto/pujgcc:latest  "/data/helloworld"      4 minutes ago  Exited (0)   4 minutes ago  optimist
ic.taussig
PS C:\Users\usuario> |
```

In fact, the container keeps on running. This is because re-starting a container turns it into a “detached process” running in the background. Alternatively, we could have added the -d option to the first docker run command, creating directly a detached container.

Finally, you can stop the container.

```
docker stop mycontainer
```

```
PS C:\Users\usuario> docker stop mycontainer
mycontainer
PS C:\Users\usuario> |
```

**This is the end of the practical session. We hope you enjoyed it. Don't hesitate to ask any questions and feel free to contact us any time after the session!**

## List of commands

Search the available versions of an image in the Docker registry:

```
docker search
```

Pulling an image:

```
docker pull
```

Starting a container on a given image running a single command:

```
docker run -ti
```

Starting a container on a given image running a single command (detached):

```
docker run -d
```

List all containers and their status

```
docker ps -l
```

List all pulled images

```
docker images
```

Removing one local container

```
docker rm
```

Removing one local image

```
docker rmi
```

Clean all containers

```
docker rm $(docker ps -aq)
```

Clean all images (after cleaning the containers)

```
docker rmi $(docker images -aq)
```

## Observations

- Deliveries must be made in teams of 4. Using a public repository on github and a pdf report
- If you do not understand the instructions for any of the activities, do not hesitate to write to [jeffersonamado.pena@javerianacali.edu.co](mailto:jeffersonamado.pena@javerianacali.edu.co).
